

Support Vector Locality Analysis — CHECKERBOARD

Hypothesis: CCKA's kernel is locally well-behaved at SVs even when globally noisy

SV count over training — checkerboard

SV-2: Local (SV) vs Global block ratio — checkerboard
Solid = at support vectors only | Dashed = full training set
CCKA expected: high solid, low dashed

SV-3: KTA lift at support vectors — checkerboard
Lift > 1 → kernel is locally better at SVs than globally

SV-1: Support vector proximity to centroids — checkerboard
Ratio < 1 → SVs cluster near centroids (boundary anchoring)

SV-4: Centroid-to-SV kernel separation — checkerboard
Solid = at support vectors | Dashed = at non-support-vectors
CCKA expected: solid >> dashed (boundary-targeted centroid alignment)

Test accuracy (reference)
